Study Indicates Promising New Approach to Prevent and Treat Cholesterol Gallstones

Activation of constitutive androstane receptors (CARs) reduces biliary cholesterol and prevents stone formation according to a new report in The American Journal of Pathology

Philadelphia, PA, March 13, 2017 – According to current estimates, 20 to 25 million Americans have or will develop gallstones, representing almost 15% of adults. Although only a small percentage of individuals with gallstones develop symptoms, more than 700,000 individuals annually undergo surgical gallbladder removal and many more take medications to manage the condition or undergo stone-dissolving procedures. A new study in The American Journal of Pathology reports on a promising new approach to prevent and treat cholesterol gallstone disease (CGD) that reduces the biliary output of cholesterol via activation of receptors present in tissues of the liver and small intestine.

“CGD is one of the most common gastroenterological disorders and the incidence rate is increasing because of improved standard of living, a chronic high-cholesterol diet, and over-nutrition. Our study indicated that the constitutive androstane receptor (CAR) plays an important role in maintaining the homeostasis of cholesterol and triglyceride levels and its activation may represent a new approach for treating CGD,” explained lead investigator Jinhan He, PhD, of the Department of Pharmacy, West China Hospital of Sichuan University, Chengdu, Suchuan (China).

Activation of CAR alters the biochemical composition of the gallbladder and hepatic bile for anti-lithogenesis (formation of stones) effects. Researchers compared mice that were injected weekly for two weeks with a medication that stimulates CAR activity to others that were administered control injections. All mice were fed with either a standard diet or a high-cholesterol/high fat (lithogenic) diet that induced gallstones.

The scientists found that 94.7% of the non-CAR–stimulant injected mice developed gallstones compared to 33.3% of CAR-stimulant–injected mice when fed the lithogenic diet. Microscopic inspection of tissue showed striking differences. Gallbladders from the non-CAR–stimulant treated mice were filled with gallstones composed of bile with aggregated cholesterol crystals. The CAR-stimulant–treated mice…
showed transparent bile free of cholesterol precipitates. After two weeks of the lithogenic diet, the walls of the gallbladders of control mice showed evidence of inflammation, which was not noticeable in the treated group.

Caption: Gross appearance of representative gallbladders. Comparison of biliary concentrations of cholesterol in mice fed a lithogenic diet (LGD) in the presence (TC) and absence (VEH) of the CAR ligand treatment.

CAR stimulation also produced related benefits, including enhanced conversion of cholesterol into bile acids and elevation of bile acid re-absorption. “Collectively, it appears that CAR plays an important role in maintaining the homeostasis of cholesterol, bile acids, and triglyceride levels,” commented Dr. He. “Whether CAR could be a novel target in preventing or treating cholesterol gallstone disease in humans remains to be further determined.”

Gallstones are most commonly formed when excess cholesterol in the bile precipitates as solid crystals, which then aggregate and fuse into stones. More common in women, formation of gallstones has been attributed to high-caloric diets, type 2 diabetes mellitus, metabolic syndrome, disorders of lipid metabolism, and obesity. Although most individuals with gallstones remain asymptomatic, about one fifth complain of discomfort and experience recurrent painful episodes; complications such as pancreatitis or cholecystitis are possible. Currently, removal of the gallbladder is the surgical treatment for gallstones, although surgery is limited by its invasive nature (even those performed laparoscopically), risk of side effects, and high cost. Gallstones may also be treated non-surgically (e.g. oral dissolution with ursodeoxycholate or lithotripsy) but these approaches have their own drawbacks. For instance, oral dissolution is appropriate for only a small proportion of symptomatic patients, may take a long time to work, and has a recurrence rate of more than 50%. Limitations for lithotripsy include stone recurrence, incomplete ductal clearance, and a small risk of serious adverse effects (such as biliary pancreatitis and liver hematoma).

About The American Journal of Pathology

The American Journal of Pathology (http://ajp.amjpathol.org), official journal of the American Society for Investigative Pathology, seeks to publish high-quality, original papers on the cellular and molecular biology of disease. The editors accept manuscripts that advance basic and translational knowledge of the pathogenesis, classification, diagnosis, and mechanisms of disease, without preference for a specific analytic method. High priority is given to studies on human disease and relevant experimental models using cellular, molecular, animal, biological, chemical, and immunological approaches in conjunction with morphology.

The leading global forum for reporting quality original research on cellular and molecular mechanisms of disease, The American Journal of Pathology is the most highly cited journal in Pathology – close to 40,000 cites in 2015 – with an Impact Factor of 4.206 and Eigenfactor of 0.05638 according to the 2015 Journal Citation Reports®, Thomson Reuters, 2016, and an h-index of 228 according to the 2015 SCImago Journal and Country Rank.

About Elsevier

Elsevier is a global information analytics company that helps institutions and professionals progress science, advance healthcare and improve performance for the benefit of humanity. Elsevier provides digital solutions and tools in the areas of strategic research management, R&D performance, clinical decision support, and professional education; including ScienceDirect, Scopus, ClinicalKey and Sherpath. Elsevier publishes over 2,500 digitized journals, including The Lancet and Cell, more than 35,000 e-book titles and many iconic reference works, including Gray’s Anatomy. Elsevier is part of RELX Group, a world-leading provider of information and analytics to professionals and business customers, in a wide range of industries. www.elsevier.com
