Supplemental Figure S2.
Supplemental Figure S2. The perivascular infiltrate contains CD45 positive cells, without a different density between different experimental models. (A) Immunostaining for CD45 and α-smooth muscle actin revealed a CD45+ infiltrate around remodeled vessels. (B) Quantification of CD45 density in the peri-vascular regions revealed no differences between infected wild-type, IL-13Rα1-/-, and IL-13Rα2-/- groups (ANOVA p = 0.081).
