Supplemental Figure S6. The peri-egg granulomas contain CD45+ cells, with little evidence of apoptosis. (A) Immunostaining for CD45 revealed there are many peri-egg leukocytes in all models of infection. There was little evidence of apoptosis by TUNEL staining. (All bars are 100um.) (B) Quantification of CD45+ profile density in the peri-egg granulomas revealed no differences between infected wild-type, IL-13Rα1−/−, and IL-13Rα2−/− groups (ANOVA p = 0.729).
