Supplementary Figure S2. Early injection of preeclampsia serum induces fetal resorption in pregnant IL-10$^{-/-}$ mice. Pregnant IL-10$^{-/-}$ were injected with normal pregnancy serum (NPS) or severe preeclampsia serum (sPE) on gestational day 8 (gd 8); animals were euthanized on gd 17, and uteroplacental units were monitored. A representative photograph showing fetal resorptions in response to treatment with sPE but not NPS is presented. This figure represents three independent experiments.
